

Natural Inquirer Wilderness Benefits Edition
As the Frog Hops

Who or What Am I?

1. I am someone who has special skills and knowledge about how to take care of the resources produced by nature. Scientific information is important to me because it helps me make better decisions. Who am I?

2. Many animals have unique life cycles. I am a type of life cycle in which an animal undergoes a complete change as it grows into an adult. This change affects the animal's body, behavior, and habitat requirements. What am I?

3. Food is a major component of an animal's habitat. I am a behavior exhibited by animals when they are searching for food and eating. An example of me is when a rabbit is searching for plants to eat. What am I?

4. I am a type of amphibian that lives in the mountains of the northwestern United States. Members of my species breed in the early summer and hibernate under the water during the winter. Populations of me have recently started to decline due to changes in the climate in the areas where I live. What am I?

5. I am a tool scientists used in this study to track the movements of frogs. I can be attached to a frog and checked by the scientists. I work by sending signals to a special device that can trace the location of the frogs. What am I?

I am a type of measurement that scientists use to understand the landscape. I am the difference or height of a part of the Earth that is taken from either above or below sea level. What am I?
